ABSTRACT

The present invention relates to a garment holding device comprising a main sheet of material rollable in a rolling direction and at least one cloth attachment means attached to said main sheet, wherein the main sheet is provided with at least two elongated elevated zones on the front side of the main sheet, essentially mutually parallel arranged at or near the edges of said main sheet and parallel to said rolling direction, such that when the device is rolled up, a curved spacing is created for holding a suit or another garment, without substantial forces being exerted thereto and without sharp bends.
